

Module 6 Assignment 6A:

MVC-Based PHP Application

Course: CS 85 - PHP Programming

Instructor: Vicky Seno

For this assignment, I created an MVC-based PHP application using Composer PSR-4 autoloading. The project is based on my real work as a photographer and my SERGIOARTG platform: <https://sergioartg.com>.

My application is a photography booking planner. It lets a user enter client and session details, then calculates the quote total, deposit due, project complexity, and booking workflow decision. The project uses a Model, View, and Controller structure. The PhotographyProject Model handles the business logic, the BookingPlannerController validates input and passes data to the

View, and booking-planner.php displays the interactive UI.

I also included AI-generated code for one method, the exact prompt I used, the raw AI output, and a critique discussing security, efficiency, correctness, style, and the changes I made.

7 ## App Description
8
9 This project is a small MVC-based PHP application for planning a SERGIOARTG photography booking. The app lets a
10 user enter a client name, service type, package, session hours, edited photo count, location type, deposit paid,
11 rush delivery option, and project note. The application calculates a quote total, deposit due, booking complexity,
12 and workflow decision.
13
14 The topic is personal because it connects directly to my real photography platform, SERGIOARTG, where photography
15 clients can explore work and request sessions.

18
19 ## Setup Instructions
20
21 From the module folder:
22
23 ```bash
24 cd assignments/module6a
25 composer dump-autoload
26 php -S 127.0.0.1:8080 -t public
27 ```
28
29 Inside the Laravel coursework project, the assignment is also available through:
30
31 ```text
32 http://127.0.0.1:8080/assignments/module6a/public/index.php
33 ```
34
35 Module roadmap URL:
36
37 ```text
38 http://127.0.0.1:8080/roadmap/module-6
39 ```
40
41 GitHub source URL:

70 ## Reflection
71
72 I chose a photography booking planner because it connects directly to my real life and portfolio work. I am
73 building SERGIOARTG as a photography platform with a public portfolio, booking requests, pricing, availability,
74 orders, payments, and client communication. For this assignment, I reduced that larger product idea into a small
75 PHP MVC application that is easy to understand and test. The app lets a user change booking inputs and immediately
76 see the quote total, deposit due, project complexity, and next workflow decision.
77
78 The Model is 'PhotographyProject'. It owns the business rules: package pricing, extra hours, extra edited photos,
79 location fees, rush delivery, service multipliers, deposit calculation, and workflow decisions. The Controller is
80 'BookingPlannerController'. It reads request input, validates values, creates the Model, and passes clean data
81 into the View. The View is 'booking-planner.php'. It displays the form, validation messages, quote summary, and
82 MVC structure.
83
84 The hardest part was deciding where each responsibility belongs. In a one-file PHP script, it is tempting to put
85 validation, calculations, and HTML together. MVC forced me to separate those concerns. The Model should not know
86 about form fields or HTML. The View should not calculate prices. The Controller should connect the request to the
87 Model and View without becoming too large.
88
89 I learned that MVC makes code easier to reason about because each file has a clear job. Composer autoloading also
90 made the project cleaner because classes can be loaded by namespace instead of repeated 'require_once' statements.
91 This is very close to how professional frameworks like Laravel organize code, but the smaller project makes the
92 pattern easier to see.
93
94 ## AI Code Review and Critique
95
96 ### Prompt
97
98 Write a beginner-friendly PHP method for a photography booking model named workflowDecision. It should return a
99 string. If deposit is still due, tell the user to send a quote and collect the deposit. If rush delivery is true
100 or the location is out of city, tell the user to review logistics. Otherwise, say the booking is ready to confirm.
101
102 ### Raw AI Output
103
104 ```php
105 public function workflowDecision() {
106     if ($this->depositDueCents() > 0) {
107         return "Send quote and collect deposit before confirming.";
108     }
109 }
```
